

used in any one of the half

1st half Syntax := LEFT (text, ROUNDUP (LEN (text) / 2, 0))
 Ex := LEFT (A2, ROUNDUP (LEN (A2) / 2, 0))
 o/p : SAHA

2nd half Syntax := RIGHT (text, LEN (text) / 2)
 Ex := RIGHT (A2, LEN (A2) / 2)
 o/p : ANA

round : rounds a no. normally based on the next digit, more than 5 $\rightarrow$ rounds up, Less than 5 $\rightarrow$ rounds down

Syntax := ROUND (Number, num - digits)
 Ex := ROUND (25.678.2), = ROUND (25.674.2)
 o/p : 25.68 , 25.67

roundup : always rounds the number away from zero

Syntax := ROUNDUP (number, num, digits)
 Ex := ROUNDUP (25.671.2)
 o/p : 25.68

even though 3rd decimal is 1, it still rounds up

round down : always rounds the no. towards zero, regardless of the next digit

Syntax: =ROUND DOWN (number, num-digits)

Ex: =ROUND DOWN (25.679, 2)

o/p: 25.67

even though 3rd decimal is a it doesn't round up

- 1 Find(): This function searches for a specific character or text inside another text and returns its position no.
- It is case-sensitive

Syntax := FIND (find-text, within-text, [start-num])

find-text = The character/text we want to find

within-text = The text where we want to search

[start-num] = optional: position from which excel should start searching

Ex: =FIND("a", "Sahana"), =FIND("a", A2)

o/p : 2

- 2 SEARCH(): This function finds the position of specific text inside another text,
- This is not case sensitive

Syntax: f=SEARCH (find-text, within-text [start-num])

Ex: =SEARCH("A", "Sahana"), =SEARCH("A", A2)

o/p : 2

3 Separating the names into first name and last name

Suppose we have Sahana L.R in the A2 cell
we want to separate

first name $\rightarrow$ Sahana

Last name $\rightarrow$ LR

How the syntax works

$\rightarrow$ =LEFT (text, num_chars)

text = The original text

num_chars = no. of characters to extract from left

Inside the formula

$\rightarrow$ FIND (" ", A2) = This finds the position of the space

$\rightarrow$ Then (-1) will remove the inside space bcz FIND (" ", A2) gives 8. bcz the space is at position 8. so -1 is used

Ex: =LEFT (A2, FIND (" ", A2) - 1)

o/p: Sahana.

4 Separating Last Name

we have Sahana LR in cell A2

How Syntax works:

→ $\text{=MID}(\text{text}, \text{start} - \text{num} - \text{num} - \text{char})$

text : A2

- $\text{FIND}(" ", A2)$ = This finds the position of the space in the full name, this returns 8.
- Then $(+1)$ = we don't want to start extracting from the space. we want to start from the first letter of the last name
So $8+1=9$, position 9 is L

→ $\text{LEN}(A2)$ = counts the total no. of chars
A2, so length is 10

Ex : $\text{=MID}(A2, \text{FIND}(" ", A2) + 1, \text{LEN}(A2))$

o/p : LR

5 $\text{CONCAT}()$: combines multiple text values into one text string

Sahana = (L2) LR = (M2)

Syntax : $\text{=CONCAT}(\text{text 1}, \text{text 2})$

Ex : $\text{=CONCAT}(L2, " ", M2)$

we need space between it so only space is specified

o/p : Sahana L.R

concat the first name and last name as
Hi Sahana L.R gm

Ex: = CONCAT("hi", " ", L2, " ", M2, " ", "gm")

o/p : hi Sahana L.R gm

- 6 Text join(): contains multiple text values and allows us to specify a delimiter b/w them

for ex: space " ", comma ",", Hyphen "-"

Syntax: =TEXTJOIN(delimiter, ignore_empty, text1, text2)

delimiter = character placed b/w each text value
ignore_empty = (True) ignore empty cells,
(False) includes them

Ex: =TEXTJOIN(" ", 1, L2, M2)

o/p : Sahana L.R

7 Substitute () : This replaces specific text with another text

Syntax := SUBSTITUTE (text, old-text, new-text)

Ex := SUBSTITUTE (Q2, "a", "A")

o/p : S@h@n@ L R

8 Replace () : This replaces characters based on their position in a text string

Syntax := REPLACE (old-text, start-num, num-chars, new-text)

old-text = original text

start-num = position where replacement should begin

num-chars = No. of characters to replace

new-text = New text to insert

Ex := REPLACE (Q2, 2, 1, "@")

o/p : ~~S@h@n@~~ L R S@hana L R
